Dear all,
Hello!
Ok, so 2 samples were mislabeled and I corrected them. And 1 sample 54 came out corrupted somehow. This caused my confusion when I tried to align the metadata and raw data, but it is fixed now. Sample 54 is fixed bioinformatically by data imputation. Please note this for your record, in case it will make a mess for you later.
Thank you.
Best regards,
Albert

There is a sample 55 in sequence. Do you have 2 55 samples. You can check samples number on autosampler.

I have samples named P40, P55, and P60 and I miss P13, P14 and P16 - so we do have all the samples, but these three seem to be miss labeled. I guess 40 is 14, 60 is 16, and 55 is 13...

Could you please check it again, cause I gave you all samples.

Ok, I see sample P40, that is not present in your metadata, so it probably was confused with P14 - makes sense. But there are no still P13 and P16.

As good as I remember, all was good. In any case, we have all samples stored and can repeat the extraction.

Thank you, Tatiana!
Just to clarify - there were no any issues during the extraction, right? No tubes fell, spill, looked odd etc?
Best regards,
Albert

Subject: metadata

Dear all,
Can you please send me all the metadata for the samples and extraction process you have? I can't progress without it at this point.
Thank you!
Best regards,
Albert
